         -!- FUNCTION: GTP-BINDING PROTEIN INVOLVED IN NUCLEOCYTOPLASMIC TRANSPORT. REQUIRED FOR THE IMPORT OF PROTEIN INTO THE NUCLEUS AND ALSO FOR RNA EXPORT. INVOLVED IN CHROMATIN CONDENSATION AND CONTROL OF CELL CYCLE (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Nuclear.
-!- SUBCELLULAR: BELONGS TO THE RAN FAMILY IN THE RAS SUPERFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Rohdei-litorin: a new peptide from the skin of Phyllomedusa rohdei."; FBBS Lett. 188:53-56(1985).

                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method for preparing a peptide or recombinant antibody, which mimics an antigenic carbohydrate. The peptides and recombinant antibodies prepared to mimic antigenic carbohydrates can be used to enhance binding of anti-antigenic carbohydrates can be used to enhance binding of anti-antigenic carbohydrate antibodies to the antigenic carbohydrate, e.g. as vaccine adjuvants. The peptides can be used to inhibit binding of a ligand to a receptor, which is an antigenic carbohydrate. The methods are used to prepare the peptides and antigenic antibodies, which mimic the antigenic carbohydrates. Carbohydrate-conjugate vaccines could be used in tumour immunity and cancer therapy. The peptides and antibodies can also be used as antibacterials. Peptides that mimic carbohydrate antigens can be formulated to develop a longer lasting immune response. Other advantages
                                                                                                                                       molecules. FHA peptides may be useful for treating medical conditions associated with defects in transcriptional control, DNA replication, DNA replication, and repair, cell cycle control or other cellular process. The method may provide valuable insights into checkpoint signalling, has important implications for the functions of other FHA domain-containing proteins and provides basis for new lines of therapy. The present sequence is a peptide used in the present invention.
                                                                           The present invention relates to assays and screening methods based on a direct interaction between fork head associated (FHA) domains and phosphorylated polypeptides, for characterizing the binding of these
                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mimotope; antigen; carbohydrate; antibody; mimic; vaccine; adjuvant; tumour immunity; cancer therapy; antibacterial; immune response; immunogenicity; anti-idiotype; T cell response manipulation.

tumour, meracrasis tequires ucracimment of maintains tumour, penetration of blood or lymph vessels and attachment to the endothelium of distant organs, ultimately resulting in the formation of new tumours. The selectin family of adhesion molecules is implicated in this process. E-selectin is a calcium-dependent molecule expressed by activated vascular endothelium. E-selectins bind to glycoconjugates or carrying a terminal tetrasaccharide Lewis antigen, which are found on tumour cell surfaces. One such Lewis antigen, which are found on tumour cell surfaces. One such Lewis antigen is Lewis Y (LeX). The binding of selectin molecules to their ligands is thought to be an important step in metastasis. Therefore, inhibition of E-selectin-dependent carbohydrate-mediated interactions is thought to be a target for anti-cancer therapy. The present sequence is a non planar-X-planar type motif. This motif is thought to bind to anti-LeY antibody BRSS-2. BRSS-2 is a peptido-mimetics of E-selectins. Peptides that block E-selectin-LeY binding and therefore adhesion of tumour cells and leukocytes to endothelial cells inhibit metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumour metastasis requires detachment of malignant cells from the primary
                                                                                                                                                          amount of antigen required for immunization; (3) peptide synthesis may be more practical than synthesis of carbohydrate-protein conjugates or the production of anti-idiotypes; (4) peptide mimicking sequences can be engineered into DNA plasmids for DNA vaccination to further manipulate T cell responses. AAY33028-Y33087 represent the carbohydrate antigen peptide mimotopes described in the invention.
of the peptide mimics are; (1) the chemical composition and purity of synthesized peptides can be precisely defined; (2) the immunogenicity of the peptides can be significantly enhanced by polymerization or addition or relatively small carrier molecules that reduce the total
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptidomimetics of carbohydrate Lewis ligands useful for modulating inflammation, metastasis and angiogenesis

The peptides were identified by modifying the p53 consensus binding sequence by substitution of an Alamine at each pos. and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.

AAR89915 standard; peptide; 6 AA.

```
This is the sequence of the p53 tumour suppressor protein minimal MDM2 oncogene protein binding site. The sequence is used to generate peptides (ARA89911-3) conteg. this sequence, which forms part of the p53 protein binding motif between amino acids 16-33 (AAR89914). The peptides were identified by modifying the p53 consensus binding sequence by substitution of an Alanine at each pos, and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse, Mdm2; murine double minute; phosphoprotein; binding; modulation; tumour suppressor; p53; oncogene; cell cycle arrest; p107; antagonist; inhibition; transcription factor; adenocarcinoma; colon; cancer; breast; lung; stomach; myeloid leukaemia; lymphoma; hyperproliferative;

                                                                                                                                                                                                                                       The peptides AAW13602-6 represent peptide fragments derived from the wild type human p53 protein. This peptide corresponds to amino acids 18-23 of the p53 sequence. The peptides are claimed peptides which are able to bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW13600). Mdm2 protein is a 90 kD composed protein phich binds and modulates the activity of the tumour suppressor protein p53. It has now been shown that the mdm2 protein cuppressor protein properties, especially in a p53-null background. Mdm2 is observed to unblock cell cycle arrest in G1 caused by over-expression of the p107 protein. The p53 peptides are examples of antagonists of the invention which are able to inhibit the oncogenic activity of mdm2. The antagonists are used to treat e.g. adenocarcinoms of the colon, cancer of the breast, lung or stomach; myeloid leukaemia; B cell lymphoma, or other hyperproliferative conditions such as restenosis. Note: this sequence is not given in the specification but is constructed from the wild type human p53 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention describes composition of matter (1) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(IJ)c-F1-(IZ)d-F2.

-(IJ)c-P1-(IZ)d-P2-(IZ)e-P^3, or -(IJ)c-P1-(IZ)d-P2-(IZ)e-P3-(IA)F-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; IJ, IZ, I3, and I4 = are each independently concert, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, prortein control in and possibly placental transfer. AAA69543 to AAAB86955 to AAAB803 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EPO; erythropoletin; TPO; tumour necrosis factor alpha inhibitor; TNF-alpha inhibitor; Interleukin lantagonist; IL-1 antagonist; TNF-alpha inhibitor; interleukin lantagonist; IL-1 antagonist; TNF) the anietic peptide; EPO mimetic peptide; IM-1 inhibitor; antiinflammatory; antitumour; immunosuppressive; cytostatic; antiinflamthitic; antidabetic; ophthalmological; anticanaemic; anorectic; antidaffertility; haemostatic; dermatological; neuroprotective; inflammatory disease; autoimmune disease; tumour growth; cancer; rheumatord arthritis; diabetic retinoptaty; infertility; obesity; sleep disorder; neurological degenerative disease; anomana; thrombocytopaenia; metastatic tumour; systemic lupus erythematosus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified peptide, mimetic; Fc domain; fusion; immunoglobulin G; IgG;
                                                                                                                                                                                                                                                                                                                                                                   Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                              multimers. (I) can have antiinflammatory, antitumour, immunosuppressive, cytostatic, antirheumatic, antiarthritic, antitumour, immunosuppressive, cytostatic, antirheumatic, antiarthritic, antitumour, immunosuppressive, cytostatic, anorectic, antiinfertility, haemostatic, dermatological, antiphactic activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, theumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, infertility, and neurological degenerative diseases. (I), comprising compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPO-minetic comprising compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency is syndrome. Absolved an existing represent amino acid and nucleic acid sequences used in the expensent involve and abilisty represent involve and abilisty ceremplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Interference; binding; p53; tumour suppressor; MDM2; oncogene; cancer; inhibition; diagnosis; treatment; malignancy; consensus; antibody.
                                                                                                                                                                                                                                       The present invention describes a vehicle-peptide molecule (I) or its

New peptides of the invention which interfere with the binding of the p53 tumour suppressor protein and the MDM2 oncogene protein contain the peptide sequences AAR89911-3 which form part of the p53 protein binding motif between amino acids 16-33 (AAR89914). Peptides contg. these sequence were identified by immobilising a library of peptides amino acids long) covering the mouse or human p53 protein and adding an extract contg. expressed MDM2 protein. The interaction was identified by the antibody D0-1. This is the sequence of a human p53 epitope for the antibody. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other

psi tumour suppressor protein and the WDM2 oncogene protein contain the peptide sequences AAR89911-3 which form part of the p53 protein binding macif between amino acids 16-33 (AAR89914). Peptides contg. these sequence were identified by immobilising a library of peptides (15 amino acids long) covering the mouse or human p53 protein and adding an extract contg. expressed MDM2 protein. This sequence represent the key amino acids in the p53 binding site required for mouse MDM2 binding. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies. New peptides of the invention which interfere with the binding of the p53 tumour suppressor protein and the MDM2 oncodene protein contain 0; Gaps 87.0%; Score 20; DB 17; Length 7; 60.0%; Pred. Production of antibody compounds, particularly catalytic antibodies - using a fibronectin type III molecular scaffolding comprising beta-strand domain sequences and modified in one or more loop sednences

Example 10; Page 41; 96pp; English.

The invention relates to a synthetic fibronectin type III (Fn3) bolypeptide monobody that comprises Fn3 beta-strand domain sequences that are linked to loop region sequences (LRSs). One or more of the loop sequences in the synthetic Fn3 vary by deletion, insertion, or replacement of at least 2 amino acids from the corresponding LRss in wild-type Fn3. Host cells containing an expression vector comprising the synthetic Fn3 nucleic acid are used for the production of the Fn3 monobody. The invention also provides methods of identifying the amino acid sequence of a polypeptide molecule (i) capable of binding to a specific binding partner (SBP) so as to form a polypeptide:SBP complex, (ii) capable of catalysing a chemical reaction with a catalysed rate constant, Kcat, and an uncatalysed rate constant, Kucat, such that the ratio of the Kcat/Kunat is greater than 10. Sequences AAW44139-46 represent FG loop sequences of yeast ubiquitin-binding monobodies.

Compounds which disrupt interaction between TRIM TRAM containing polypeptides can be used therapeutically to prevent or treat viral diseases and tumours. The polypeptides reduce susceptibility of cells to viral infection and regulate cell cycle antibodies against the TRIM or TRAM sequences. HPV types associated with high risk or low risk of cervical cancer can be distinguished with high risk or low risk of cervical cancer can be distinguished (CBP) TRAM sequence. The present sequence represents a TRIM sequence given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a polypeptide comprising a transcriptional adaptor motif (TRAM) or a TRAM-interaction motif (TRAM) or a TRAM-interaction motif (TRAM) (I). (an be used for identifying compounds (II) comprising a polypeptide capable of disrupting an interaction between a TRAM sequence and/or a TRAM sequence or a TRAM sequence are identified by incubating, the polypeptide with (I) and determining if the polypeptide interacts with (I). Compound (II) is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polypeptides cells useful for treating viral disease and cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to fibronectin type III (Fn3) molecules comprising a stabilising mutation as compared to a wild-type Fn3. Fn3 can be used as a scaffold to engineer artificial binding proteins.

Modifications of the Fn3 scaffold that increase its stability are useful in that they allow the introduction of more mutations for better functions, and that these make it possible to use Fn3-based engineered proteins in a wider range of applications. The present sequence is a peptide described in the exemplification of the invention.

The present invention describe a method for detecting target hepatitis GB virus (HGBV) nucleic acid (THN) in a test sample (T) suspected of contraining HGBV. The method involves reacting (T) with a HGBV polynuclectide probe (I) containing 15 contiguous nuclectides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of newly ascertained etiological agent of non-A, non-B, non-C, non-D and non-B hepatitis causing agents collectively termed as hepatitis GB virus. AAA55270 to AAA55489 and AAB089885 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Soybean, glutathione-S-transferase, GST, homoglutathione synthetase, HGS, beta-alanine, gamma-glutamylcysteine, herbicide.

sequences from soybean for producing plants which are resistant and tolerant to herbicide comprising fomesafen and/or acifluorfen Novel glutathione-S-transferase and homoglutathione synthetase

Claim 9; Page 39; 64pp; English.

The invention relates to new soybean glutathione-S-transferase (GST) and a homoglutathione synthetase (HGS). The HGS is capable of catalyzing the addition of beta-alanine onto gamma-glutamyloysteine. Polynucleotides encoding the proteins of the invention are useful for producing plants which are resistant and/or tolerant to a herbicide comprising fomesafen plants with further desired agronomic trait, especially resistant to a herbicide, comprising glyphosate or its salt. Further desired agronomic traits altered field, altered nutritional value, altered quality or any other desirable agronomic trait. GST or its variant is also useful as a selectable marker gene. The present sequence represents a Glycine max HGS protein fragment.
